

05 **CAUTION:** In addition to referencing Handbook methods, architects and specifiers should specify tile and installation materials, including specific locations of movement joints on drawings.

Use American National Standards Institute (ANSI) standards for developing specifications. Specifications shall conform to local building codes, ordinances, trade standards and practices, and climatic conditions. All of these, along with variations in materials and labor, influence the final cost of installation. Use of materials and methods, not specifically designated by the architect, will, of necessity, be determined by the tile contractor.

Base/Cove Alternatives

Appropriate trim shapes and details must be specified by the architect, or left to the discretion of the tile contractor.
